## Assignment 2

### User Documentation:

My code is very simple, simply displaying a map of California, and using a heatmap display in various ways to show different information. Putting in a more detailed legend for how the maps are colored may have been a good idea, but the way I wrote what each was on the button should be self-explanatory. The relative simplicity of the code makes it very easy to understand for anyone who understands d3 coding. The code itself is easy to extend and refactor, since each addition of a new map only requires a dozen more lines of code, mostly for programming the button.

I also received comments that it might help to put multiple simultaneous displays simultaneously, to make for easier comparisons. However, the way it currently works should be fine in that it allows for analysis of all data at once county by county by using a tooltip.
